What are vanadium redox flow batteries (VRFB)?

Interest in the advancement of energy storage methods have risen as energy production trends toward renewable energy sources. Vanadium redox flow batteries (VRFB) are one of the emerging energy storage techniques being developed with the purpose of effectively storing renewable energy.

What is a redox flow battery (VRFB)?

The most promising, commonly researched and pursued RFB technology is the vanadium redox flow battery (VRFB). One main difference between redox flow batteries and more typical electrochemical batteries is the method of electrolyte storage: flow batteries store the electrolytes in external tanks away from the battery center.

Can a three tank system be used in a VRFB?

A three-tank system can be used, typically with a one-pass flow through configuration at the electrode, in which two supply tanks lead to a single storage tank for the mixed electrolyte, but this system is inefficient for the same reasons as a one-pass flow through model. Ideally, the tank system within a VRFB will be sealed.

How does a VRFB work?

(a) Charging and (b) discharging process depictions of a VRFB. In a VRFB, both electrolytes use the same active species, which reduces capacity loss due to cross-contamination of electrolytes, and generates an output voltage of 1.26V. VRFBs can typically store between 20 and 30Wh/L of electrolyte, depending on the concentration.

What are the components of a VRFB?

Literature review The primary components of a VRFB include an electrolyte, membrane, electrode, bipolar plate, gasket, collector plate, storage tank and pumps. A literature review for these components was performed to further understand the design considerations, limiting factors and research to address the limitations.

Should a VRFB tank be sealed?

Ideally, the tank system within a VRFB will be sealed. There should be as little contact as possible with the electrolyte and any air. As discussed, V^{2+} is eagerly oxidized to V^{3+} by oxygen gas. This is a system loss and effective design of a tank system will minimize this.
