

Gel battery storage cost vs benefit calculation in Indonesia

Why is battery energy storage system important in Indonesia?

However, given the challenge of Indonesia's geological landscape, with many off-grid and remote areas, there is a growing intermittency issue that hampers the development of solar and wind generation. Hence, the battery energy storage system (BESS) technologies have a critical role in the development of Indonesia's renewable energy.

How does a battery energy storage system affect power quality?

This imbalance often results in grid instability and compromises power quality. Battery energy storage systems (BESS) store excess renewable energy and discharge the stored energy when it is needed. By mitigating renewable energy fluctuations, BESS can enhance the integration of renewable energy into the grid.

When will a battery storage facility be built in Indonesia?

In the BAU scenario, the construction of battery storage facilities commences in 2030 for 2-hour (2H) duration batteries in provinces such as East Java, Jakarta, Lampung, and Riau, followed by other provinces except Aceh, North Sumatra and West Java starting in 2035.

Should a battery energy storage system be developed?

Policies that incentivize BESS projects should be developed. Battery energy storage systems (BESS) have emerged as a solution for mitigating the intermittent nature of solar and wind power with the rise of renewable energy. The application of BESS is essential in integrating large-scale renewable energy.

Are renewables a good source of energy in Indonesia?

As shown in Fig. 2, despite an overall boost in energy generation, renewables only slightly improved their contribution to the energy mix, from 11.24% to 13%, with hydro and geothermal sources registering modest increases (Ministry of Energy and Mineral Resources Indonesia, 2023). Fig. 2.

Can geothermal energy be used in Indonesia?

Among the few countries that have the resources and skills to use geothermal energy, with an installed capacity of about 2.3 GW by 2021. The more energy that can be taken out of the geothermal reservoir, the more electricity can be generated. Indonesia has many geothermal resources above 225 °C (high-temperature category). It allows developers to
