How much does a solar system cost in Greece?

The average cost of a solar system in Greece is EUR3 per watt. To account for the typical energy usage of the average home in Greece, most homeowners require a 4.2-kilowatt system. Using the per-watt figure above, a solar installation costs about EUR8,600, or EUR6,450 after the federal solar tax credit of 25% is applied.

How much solar capacity will Greece have in 2022?

In 2022, 1.4 GW of new PV projects were connected to the grid, bringing the cumulative capacity to 5.5 GW. This was the best performance ever for the Greek solar sector. Still, it looks modest if you compare it with the expected performance of the market in 2023 which should bring online around 1.7 GW of solar capacity.

How has the Greek solar market performed in 2022?

The Greek solar PV market has gained tremendous momentum, which is expected to continue for the next few years. In 2022, 1.4 GW of new PV projects were connected to the grid, bringing the cumulative capacity to 5.5 GW. This was the best performance ever for the Greek solar sector.

What is the cost optimal range for a solar system?

Compared to the EU's 2030 target of 383-592 GW of solar capacity, our results show that in a range of 530-880 GW of PV combined with battery storage equivalent to 2.5-7.5% of the total intermittent capacity represents the cost optimal range in the system.

Is battery energy storage a solution to Europe's energy crisis?

Europe is at the forefront of decarbonisation efforts, with already achieved results and ambitious goals for the coming decades, particularly in the power sector. However, the greening of the European electricity system also requires increasing flexibility. Battery energy storage systems (BESS) represent a crucial component of the solution.

Could a 5% battery capacity ensure optimal integration of PV in Europe?

A 5% battery capacity level could ensure optimal integration of PV in Europe. The varying level of RES curtailment could be handled by 5% battery capacity. Country heterogeneity is observed in the optimal level of batteries. Batteries can ease the strong cannibalisation effect of PV plants.

Subsidies for households range from 45% to 75% of the total cost depending on their income, while for farmers they are 40% to 60%. It means the program covers EUR 10,000 to EUR 16,000 for a rooftop PV combined with a ...
